

CS482 Software Project: Orange County Little League

Jonathan Dargakis, Crystal Ajayi, Stuart Belvin, Matthew McCurdy

2025-12-10

1 Client Information

- Client name: Eric Ebert
- Client title: Assistant Teaching Professor
- Client email address: eebert@loyola.edu
- Client employer: Loyola University of Maryland
- How you know the client: Mr. Ebert was introduced to us through Dr. Henrique Rocha

2 Project Description

2.1 Overview

Our client Mr. Ebert is asking us to create a baseball youth sports league website where different users can perform different tasks. The goal is to manage teams, schedules, matches, registration, and live updates in a secure, easy to use platform while protecting the privacy of minors.

2.2 Key Features

User Roles & Permissions

- Admins can manage the entire league, update match info, modify access levels, and update website content.
- Team Managers can manage their teams, send invites to parents/youth, and access match details.
- Parents can register themselves and accept team invitations.
- Youth can upload basic contact information.
- Guests can view the landing page and demo form but cannot access youth images.

Match & League Management

- Calendar with match date, time, location, and type (normal, playoff, final).
- Automatic playoff brackets based on season rankings.
- Auto-generation of championship brackets for the top 8 teams.
- Live match score updates with a live feed placeholder.
- Data saved automatically after each match.

Season & Score Tracking

- Scoreboards showing wins, losses, ties, and points.
- Ability to view previous seasons.

User Interaction

- Comment section for live matches (clears after each match).
- Rating system for team managers and matches.
- Social media link integration.

Safety & Privacy

- No images of underage children shown to guests.
- No youth trading between teams.

2.3 Why this Project is Interesting

This project is interesting because this would include building a full stack website. Working with the front end and a backend database to display and manage data. And there are many cool features that our client wants to implement such as having users be able to sign in and out and implementing a calendar on the home page. Which is something we have not worked with, so it will be interesting learning and implementing all the user stories.

2.4 Areas of CS required

- Web Development (frontend + backend)
- Databases and Data Modeling (users, roles, matches, stats, seasons)
- Cybersecurity (protecting youth data, access controls, safe authentication)
- Software Engineering (system design, requirements, testing, project planning)
- Real-Time Systems (live match updates and dynamic brackets)

2.5 Potential Concerns and Questions

We are not sure if we'll be able to make the live update system work smoothly and reliably as well as create the automated bracket system correctly rank teams and placing them into a playoff bracket based on their performance.

3 Requirements

3.1 Non-Functional Requirements

ID	NFR Title	Category	Description
NFR1	Role-Based Access Control	Security	Users should only see pages and information that match their assigned role. Guests shouldn't see child images.
NFR2	Mobile-Friendly Interface	Usability	The interface should be easy to navigate on both desktop and mobile devices for parents, youth, and managers.
NFR3	Basic Data Protection	Security	User passwords and youth information should be stored safely and not visible in plain text.
NFR4	Reasonable Load Time	Performance	Main pages should load in a few seconds during normal use.
NFR5	Simple Live Updates	Performance	Score updates should appear on the screen shortly after being submitted.
NFR6	Stable Functionality	Reliability	The website should run without crashing.

Table 1: Non-Functional Requirements

3.2 Functional Requirements (User Stories)

ID	Story Title	Points	Description
A1	Sign In / Out	1	As an Admin, I want to log into my account so that I can securely access admin-only information.
A2	Sign-Up Disclaimer	1	As an Admin, I want a disclaimer shown to parents so that they understand their responsibilities and how their child's data will be used.
A3	Promote / Demote	1	As an Admin, I want to change access levels so that I can promote or demote users between parent and manager roles.
A4	Enter Points	1	As an Admin, I want to enter team points during a game so that viewers can see updated scores.
A5	Calendar CRUD	8	As an Admin, I want to create and edit calendar entries so that users know the date, time, and type of each match.
A6	Championship Bracket	1	As an Admin, I want an automatic bracket of the top 8 teams so that users can see playoff placement.
P1	Register Parent + Child	2	As a Parent, I want to register myself and my child so that I can manage my child's information.
M1	Send Team Invites	2	As a Manager, I want to send invites to children (approved by parents) so that I can build a team roster.
U1	View Landing Page	1	As a User, I want to view the landing page so that I can see general information about the league.
U2	View Calendar	1	As a User, I want to view a calendar so that I can see match dates, times, places, and types.
U3	View Scoreboard	2	As a User, I want a scoreboard so that I can see team points, wins, losses, and ties.
U4	Leaderboard	2	As a User, I want an automatic leaderboard so that I can see which teams are performing best.
U5	Live Game View	5	As a User, I want to see live scores and time remaining so that I can follow matches online.
U6	Rate Matches	2	As a User, I want to rate matches and team managers so that I can share my feedback.
U7	View Seasons	2	As a User, I want to view past and current seasons so that I can see historical stats.
U8	Live Comments	2	As a User, I want to post temporary comments during a live match so that I can interact in real time.
U9	Post Media	2	As a User, I want to upload photos and videos to the landing page so that I can share media with others.
U10	Minor Image Flag	1	As a User, I want to flag images containing minors so that their identities are hidden from guests.
U11	View Profiles	1	As a User, I want to view user profiles so that I can learn about other participants.

Table 2: User Stories

4 System Design

4.1 Architecture

For this project, we will be using the MVC architecture. This architecture will be composed of three layers, each with their own modules.

The Model layer defines data schemas and handles database communication with MongoDB collections via Mongoose. Including UserModel to manage user data such as name, email, and password, EventModel to store calendar event details like title date, time, description. An AuthModel to manage authentication tokens and session validation and a Data Base connection model to connect to the production and test mongo database.

The View layer consists of front-end templates and React components including the Login/Register page, the main Dashboard, EventForm, CalendarView, and ProfilePage

The Controller layer receives user requests, manipulates the Model, and returns a View or data Which could include the UserController, AuthController and EventController

4.2 Diagrams

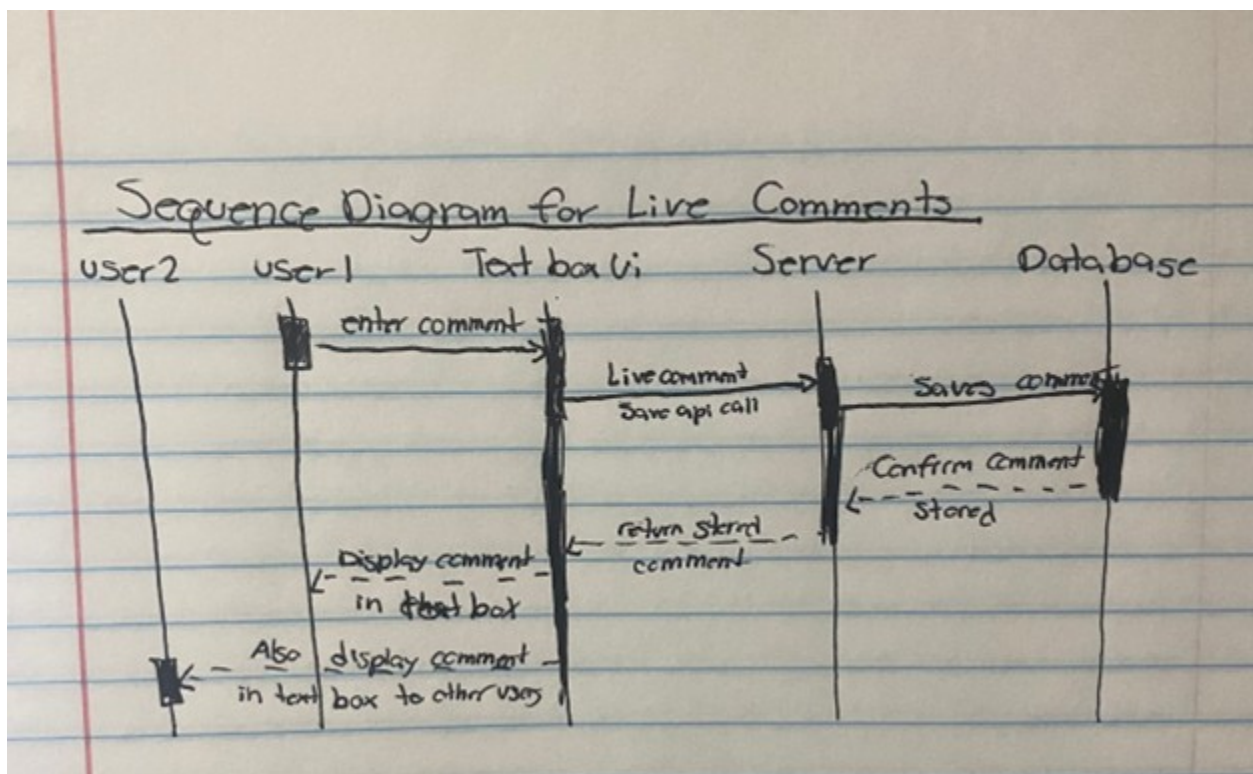

Figure 1: Sequence Diagram for Live Comments

The current state of Live matches is unknown but for this For an event we would have the start time and then the length of a game to get the end time and in that window the game will be in a state of in-progress where the admin can change the scoreboard points and when the time is up the game will be in a state of passed and stores the event data on the game. And for the comments have the input and with time stamp so you know which messages appeared when and can be replayed at the same time intervals based on the time stamps and for the game while in the in progress state a user can Like/Dislike the game.

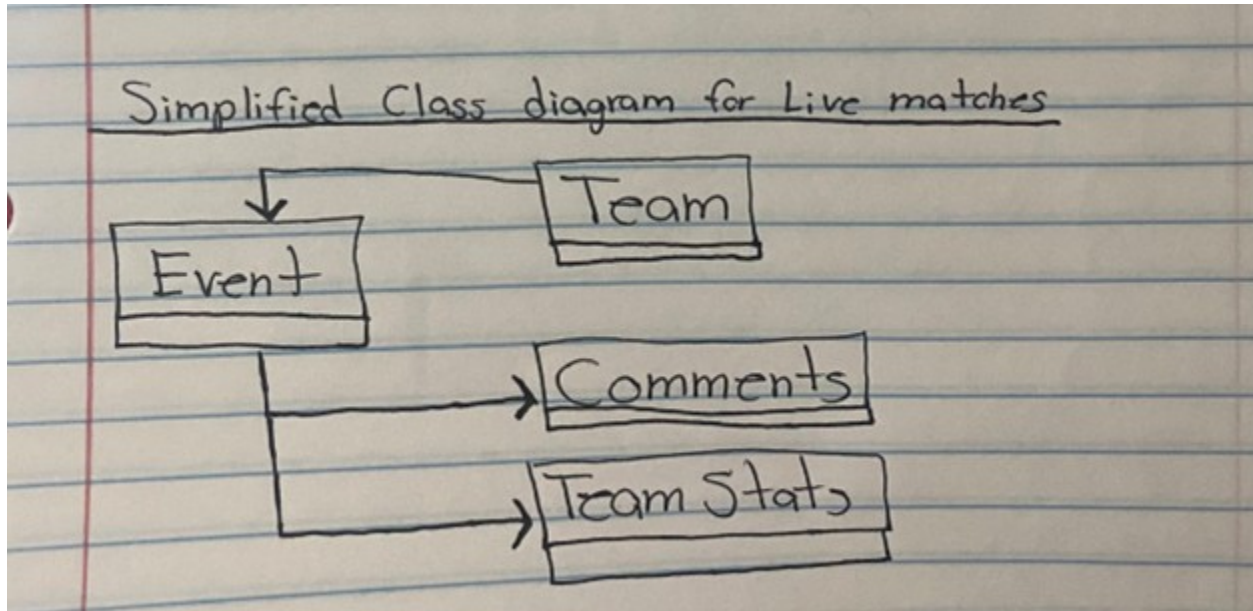

Figure 2: Simplified Class Diagram for Live Matches

4.3 Technology

For our frontend, we will be using the React framework, and we will be using Vite as our build tool. We will also be using Tailwind Css for our styling. For our backend, we will be using Node.js for our runtime, Express.js for our framework, bcrypt for our password hashing, and JSON Web Token for our authentication. For our database, we will be using MongoDB with Mongoose for schema modeling and database interaction. And for the calendar we will use FullCalendar, an open source JavaScript library for event management and displaying the calendar. We will be using Jest for our testing, along with the build-in mock system inside of Jest. We will be using dotenv to securely load our environment. For our deployment, we will be using Railway. And we are going to implement Github Actions in the main branch to make sure that only viable and approved commits are allowed to be pushed passing all of the tests in the pipeline.

4.4 Coding Standards

We will be using Pascal case for our schemas and file names, and all lowercase for our folder names. For our variable and function names in JS, we will be using Camel case. For our design, we will focus on simplicity, functionality, and ease of use over pure looks.

All code that is pushed to main should have unit tests and coverage that is over 70%. We will all use the project board to communicate which tasks we are working on. When working on the project, we will create a working branch which will only be merged with the main branch when they have been tested and reviewed after each iteration. We will implement a .env file to hide sensitive information. We will follow our user stories and always include the # in our commits so they link to the user story we are working on. We will commit frequently and always include meaningful commit messages. When we find a bug, we will add tests to specifically test that the bug has been eliminated, so we know if that bug ever shows up again. When testing our code, we will use our test database and not the main database. Our code will be

object-oriented and modular to improve readability. And if needed we can implement pair programming to tackle big/ complex user stories.

5 Iterations

5.1 Iteration Planning

Iteration	Dates	Stories	Points
1	01/01 - 02/01	Website Design, E2-Calendar Features, U4-Leaderboard, U3-Scoreboard, A1-SignIn/Out	15
2	02/01 - 03/01	A1-SignIn/Out, P1-Register Parent and Child, A2-Sign up Disclaimer, A3-Promote/Demote, U11-View profile, U4-Leaderboard, U9-Post to landing page, U10-Minor flag, A4 - Enter points	19
3	03/01 - 04/01	U1-View Home Page Info, U7-Seasons, Web-Page UI	5
Total:			39

Table 3: Iteration Planning for Incremental Deliveries

5.2 Iteration/Sprint 1

5.2.1 Planning

Jonathan

- Build Website Design and interface (1 pt)

- E2 - Calendar Features (3 pts)

Total: 4 points

Crystal

- E2 - Calendar Features (3 pts)

Total: 3 points

Stuart

- E2 - Calendar Features (3 pts)

Total: 3 points

Pair Programming: Jonathan, Crystal, and Stuart plan to work on E2 - Calendar Features (9 pts), each earning 3 points

Reasoning: Jonathan, Crystal, and Stuart planned on work on this Epic the first iteration because it was one of the biggest point Epics and the calendar was on the home page and was what is going to be most viewed, so we want to knock this Epic out first.

Matthew

- U4 – Leaderboard (2 pts)

Total: 2 points

- Build website and Design (1 pt) – To have a Navbar and Footer setup for each page.
- E2 – Calendar Features (9 pts) – This was our main focus for this iteration, as we wanted to have fully working CRUD operations for a calendar to display events and work with routes and database operations. Now that we have a history of events in the database, we can use the same data and just add scores and ratings for when we want to use it for the live game view.
- U4 – Leaderboard (2 pts) – To show which teams are winning.

Total Points: 12 points

5.2.2 Work Done

In this iteration Jonathan has completed setting up the DB and programming environment the home page, which includes the Navigation bar and footer for every page.

Another story that was completed was a full CRUD calendar. As Crystal worked on the admin page viewing the calendar and being able to click on a date to edit it. Stuart added the EventDao and EventDao Tests. Jonathan worked on the EventController and EventController tests, Server routes/ api calls and Home page Calendar view.

5.2.3 Testing Coverage

File	% Stmts	% Branch	% Funcs	% Lines	Uncovered Line #s
All files	97.64	70	100	100	
controller	100	100	100	100	
EventController.js	100	100	100	100	
model	95.34	50	100	100	
DbConnection.js	90.9	50	100	100	6-7
EventDao.js	96.87	50	100	100	44
Test Suites: 2 passed, 2 total					
Tests: 21 passed, 21 total					
Snapshots: 0 total					
Time: 3.544 s					

Figure 16: Testing Coverage

This coverage is good because it goes through every test except for in the Dao when there is no event it just returns null and in the DB connection it says it is not using the testdb even though the testdb works and has been used.

5.2.4 Retropective & Reflection

Some challenges during this iteration was communication as we did not really know who was working on what except for a few people. And time management as some people started early and worked on it little by little while others waited until the last day to start working. And there are few commits in the repo showing what you are working on and making sure that you are on the working branch.

So for next iteration we should commit more often and start earlier so that we are not rushing and have clear communication on what we are doing utilizing the story project board and Discussion tab.

5.3 Iteration/Sprint 2

5.3.1 Planning

Jonathan

- U9 - Post to Landing Page Feed (2 pts)
- U10 - Minor Flag (1 pt)
- A4 - Enter Points (1 pt)

Total: 4 points

Reasoning: I chose these user stories because I had already started learning how to upload an image from the Spike. Using what I have learned, I created the image gallery with image upload functionality. The Minor Flag story ensures that only images of minors are shown when logged in and that an admin can remove inappropriate pictures.

Crystal

- A1 - SignIn/Out (1 pt)

- P1 - Register Parent and Child (2 pts)

Total: 3 points

Reasoning: I chose these stories because I previously wanted to do them in the first iteration but chose to focus on something else instead.

Matthew

- A3 - Promote/Demote (1 pt)
- U11 - View Profile (1 pt)
- U4 - Leaderboard (2 pts)

Total: 4 points (or 3 points if Leaderboard is partial)

Stuart

- S3 - Countdown Timer Spike (2 pts)
- U5 - Live Game (5 pts)

Total: 7 points

5.3.2 Work Done

Jonathan: In this iteration, I completed the gallery which includes the minor Flag and added editable scoreboards, but once others complete their stories i can go back and officially add the user privileges when viewing the gallery and scoreboards instead of the temporary fix. So, guests cannot see minor flags and cannot edit the scoreboards based on their sessions.

Crystal: I created the Sign In/Out page and created the registration of the parent and child. The child must enter the parent's email for their account to be registered. Some aspects of the login process are not working as intended, especially with the team manager role. These bugs must be resolved in the next iteration.

5.3.3 Testing Coverage

File	% Stmts	% Branch	% Funcs	% Lines	Uncovered Line #s
All files	98.68	84.21	100	100	
controller	100	100	100	100	
EventController.js	100	100	100	100	
ImageController.js	100	100	100	100	
model	97.18	57.14	100	100	
DbConnection.js	90.9	50	100	100	6-7
EventDao.js	96.87	50	100	100	44
ImageDao.js	100	100	100	100	
Test Suites: 4 passed, 4 total Tests: 43 passed, 43 total Snapshots: 0 total Time: 3.283 s					

Even though this coverage shows it has 100 percent coverage including the newly added ImageDao tests, handling the input images and dealing with the minor flag. There is untested code in the repository such as UserDao and UserController that the coverage was not able to pick up. So in Reality the code coverage is insufficient as it is lacking two files

5.3.4 Retroerspective & Reflection

Some of the pitfalls during this iteration would be communication as we did not know what others were planning on doing this iteration and committing their progress to show what they are currently working on.

Another issue was when trying to reword a commit message without the issue link all of the commits after that was somehow duplicated, and it was decided to leave it alone to not further mess up the branch by trying fixing something that had little to no impact. And now added the final git command to implement your new commit message in the discussions tab for future reference, so that this problem does not happen again. We also need to make sure to commit all line of code before the deadline with all testing complete.

5.4 Iteration/Sprint 3

5.4.1 Planning

Jonathan

- U7 - Seasons (2 pts)
- U1 - View Home Page Info (1 pt)
- Web Pages UI Design (2 pt)

Total: 5 points

Reasoning: I chose these user stories because I had already been working in Figma to create a better looking leader board and I wanted to add more info about the League to the home page instead of just A small calendar and gallery and I have been working on the Teams and wanted to create a Seasons view with A Ui and implementing my already created Scoreboard component, So I was able to reuse that style in the UI for the Seasons.

Crystal

- A2 - Promote/Demote (1 pt)
- A3 - Sign Up Disclaimer (1 pt)
- M1 - Send Invites (2 pts)
- U11 - View Profile (1 pt)

Total: 5 points

Reasoning: I chose to work on these user stories because I already worked on the Login/SignUp feature and I felt like these stories related well to them. It felt similar to what I had already done and they all connected to the core authentication and user-management flow. I also wanted to do the disclaimer and fix some issues I wasn't able to complete in the previous iteration.

Mathew

- No stories

Total: 0 points

Stuart

- No stories

Total: 0 points

5.4.2 Work Done

Jonathan: I was able to complete the Ui design adding A Leader board UI and seasons Ui and working on component for the home page. And I was able to add info about the Sports league so that someone can better understand what the league is about. And I was able to create a mostly working Seasons backend Creating a page for an admin to create a team that utilizes the users which i would want to use for events and team stats storing all of the scores for each and all games.

Crystal: This iteration I spent a lot of time cleaning up and fixing parts of the login system that I wanted to change from my previous work. Once I sorted that out, I added the sign-up disclaimer so parent users can't complete registration unless they acknowledge it. I moved on to the View Profile feature, making sure users can see their correct information once they're logged in. After that, I added the promote/demote feature for administrators to manage user roles but at times it doesn't update to the changed role. Finally, I built the send-invites feature so managers can invite players(max 15) to their teams and players can accept or reject invitations. I also added some tests and allowed Team Managers to change the name of their teams.

5.4.3 Testing Coverage

File	% Stmts	% Branch	% Funcs	% Lines	Uncovered Line #s
All files	99.81	97.08	100	100	
controller	100	97.89	100	100	
AuthController.js	100	98.64	100	100	26
EventController.js	100	100	100	100	
ImageController.js	100	100	100	100	
TeamController.js	100	100	100	100	
TeamInviteController.js	100	96.15	100	100	66,186
TeamStatsController.js	100	100	100	100	
UserController.js	100	94.44	100	100	41
model	99.27	87.5	100	100	
DbConnection.js	90.9	50	100	100	6-7
EventDao.js	100	100	100	100	
ImageDao.js	100	100	100	100	
TeamDao.js	100	100	100	100	
TeamInvite.js	100	100	100	100	
TeamInviteDao.js	100	100	100	100	
TeamScoreDao.js	100	100	100	100	
TeamStatsDao.js	100	100	100	100	
User.js	100	100	100	100	
Test Suites: 14 passed, 14 total					
Tests: 237 passed, 237 total					
Snapshots: 0 total					
Time: 5.844 s, estimated 8 s					
Ran all test suites.					

Figure 17: Iteration 3 Coverage

Jonathan: This coverage is good because it has the same coverage as the previous iteration plus a 100 percent coverage of the newly added TeamDao/Controller and TeamStatsDao/Controller showing everything is working. And I was even able to add tests for User.js.

Crystal: I created test coverage for the team invitation system, the authentication and authorization system, user profile management, and the scoring system.

5.4.4 Retroerspective & Reflection

Jonathan: Some challenges i found were trying to connect all of the models together as I wanted to create a team with just its name, logo, manager, and players and use the name to use for events to store home team and scores, location, field, inning, and rating and use that for the seasons to store the games and gather all of the scores for team stats. Using all of these models together instead of creating separate models ever time which was why I had to convert the two already created team models into one.

Also need communication and git history...

Crystal: One of the biggest challenges this time was dealing with older login code that didn't work properly. It ended up being more of a connection to the server issue than a code problem. I also had to do a lot of logging in and out of different roles to see if everything was working properly and doing a bunch of changes once a role didn't do what it was supposed to do. A big takeaway for me is how important communication and clean Git history are. I definitely need to make more frequent commits and tie them clearly to stories to make the workflow smoother.

Matthew: No Reflection **Stuart:** No Reflection

6 Final Remarks

6.1 Overall Progress

Overall, we have completed a significant portion of the project but unfortunately, we were unable to finish it in its entirety. We completed User Roles & Permissions, Safety & Privacy, and small parts of both Match & League Management and Season & Score Tracking. Which is roughly 50% - 60% of the project and at this point users can log into different roles, view their profiles, send invitations to players (managers), view the calendar with upcoming matches, and post to the landing page feed, and more. While the project is not fully complete, it still has a baseline that Mr. Ebert can build upon and still brings satisfaction.

6.2 Project Reflection

Jonathan

During this project I was able to learn about building a front end and being able to work with a database. Being able to connect the front end and back end through api calls through the server.js file. And this project has taught me about how important time management is because of how time consuming working on a website can be and you want to take your time and not rush at the end. I have learned to utilize a lot of new tools such as Figma, Canva, project board, SCRUM, jest, and Github Actions. Some lessons I learned was how important communication is in a team and how quickly you can fall apart with out it. In the future for other project i have learned that it is important to have a strong structure of schemas that work together instead of just creating specific ones for each task it would be nice to have planned for all of the interactions between them and how they would share their data.

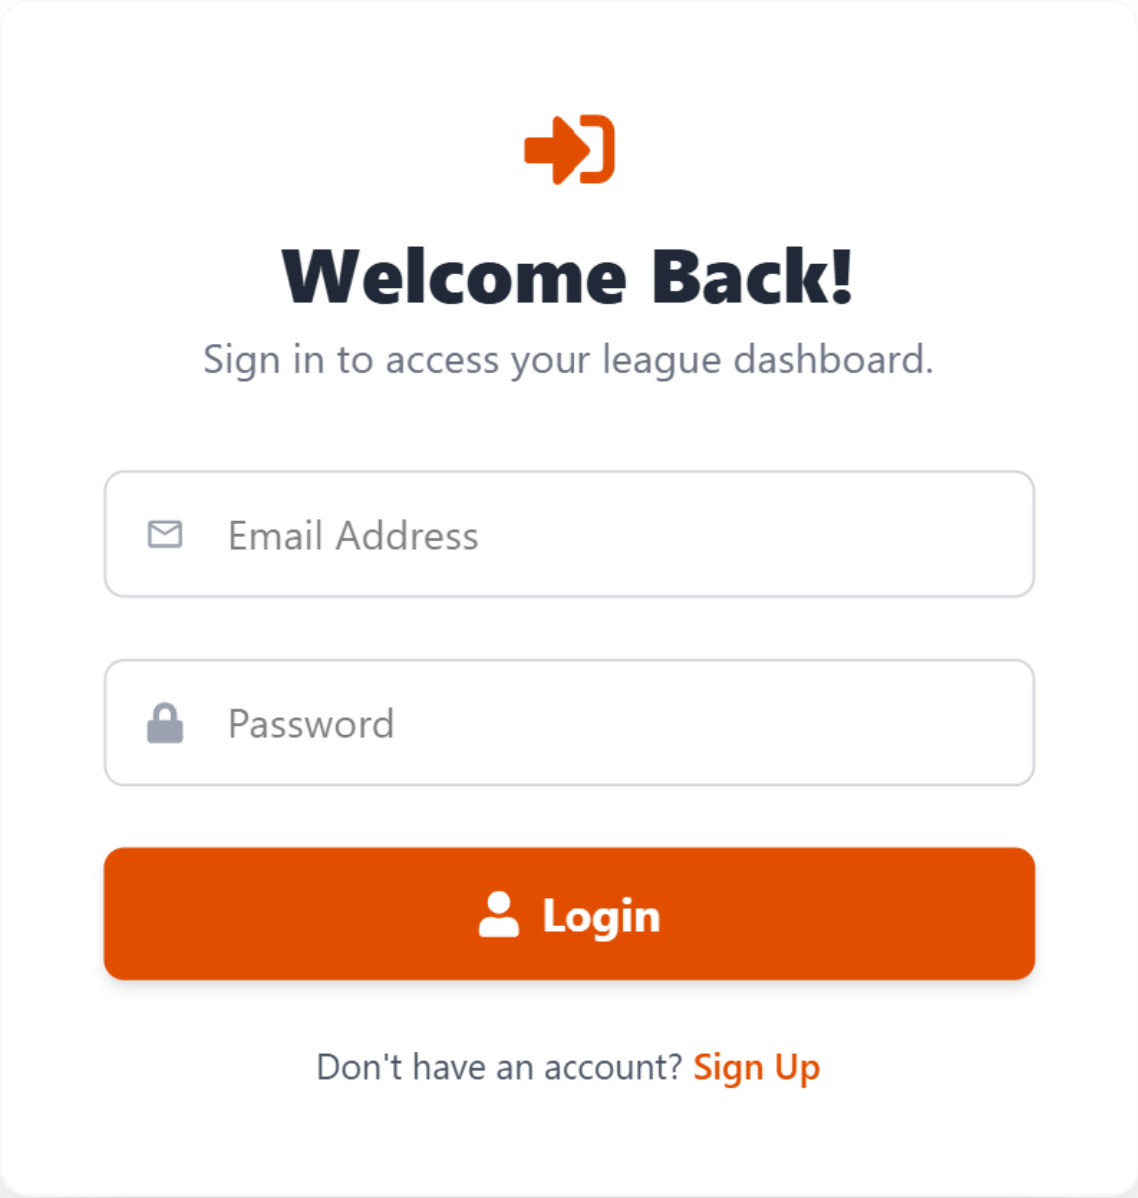

Crystal

Through my experience of this project, I learned a lot about working in a group. In my opinion, the most important part about working with others is communication and organization. A lot can go wrong when those two things are not executed correctly. I know moving forward I need to communicate consistently and meet with my partner at a designated time/place multiple times a week. I also learned a lot from my fellow partner Jonathan. He showed many traits of a good leader and was my go to when I was confused or needed help with something. He routinely made commits to GitHub and organized the project very effectively. Moving forward I want to embody some of the traits Jonathan showed me over the process of this project. I hope to use everything I learned in this project effectively next semester in my capstone.

Matthew

Appendix

The image shows a login page with a white background and a subtle shadow. At the top center is an orange icon of a right-pointing arrow with a bracket. Below it is the heading "Welcome Back!" in a large, bold, dark blue font. Underneath the heading is the text "Sign in to access your league dashboard." in a smaller, gray font. There are two input fields: the first is labeled "Email Address" with an envelope icon, and the second is labeled "Password" with a lock icon. Below these fields is a large orange button with a white user icon and the text "Login". At the bottom, there is a link that says "Don't have an account? Sign Up", where "Sign Up" is in orange.

Good Sportsmanship

Respect for the Game

True champions understand that how we play is just as important as the outcome. We honor the game, our opponents, and ourselves through respect and fair play.

Unity & Support
We win together, we lose together

Mentorship
Coaches guiding the next generation

Positive Energy
Enthusiasm that inspires everyone

Respect

Treating teammates, opponents, coaches, and umpires with dignity and courtesy at all times

IN PRACTICE:

- Shaking hands before and after every game
- Listening to coaches and officials
- Supporting all players on the field

Integrity

Playing fair and honest, following the rules even when no one is watching

IN PRACTICE:

- Being honest about calls and plays
- Following game rules and league policies
- Taking responsibility for mistakes

Team Spirit

Supporting each other, celebrating together, and learning from every experience

IN PRACTICE:

- Encouraging teammates during tough moments
- Celebrating others' successes
- Working together toward common goals

Positive Attitude

Maintaining enthusiasm and optimism whether winning or losing

IN PRACTICE:

- Staying positive during challenges
- Learning from losses and setbacks
- Being a good sport in victory and defeat
